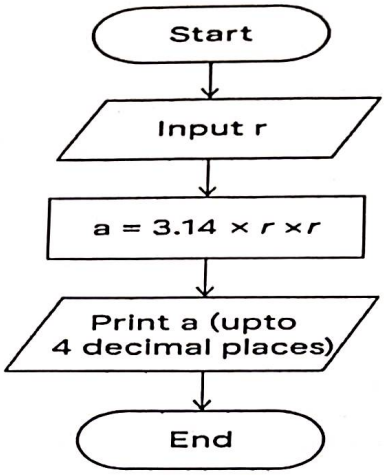
PROBLEM 1.1.1

Flowchart



Algorithm

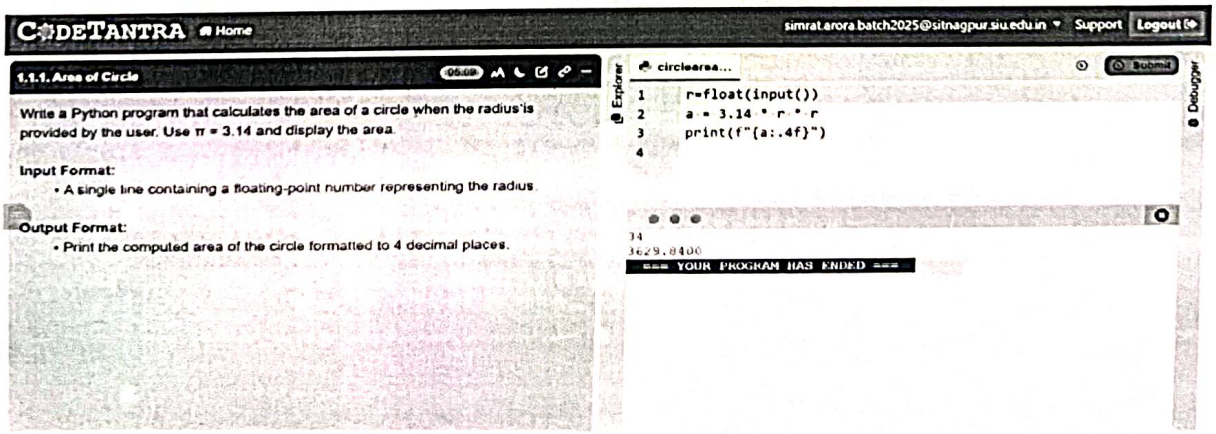
**Start**

**Input:** Read the radius (r).

**Process:** Calculate the area by multiplying 3.14 * r * r.

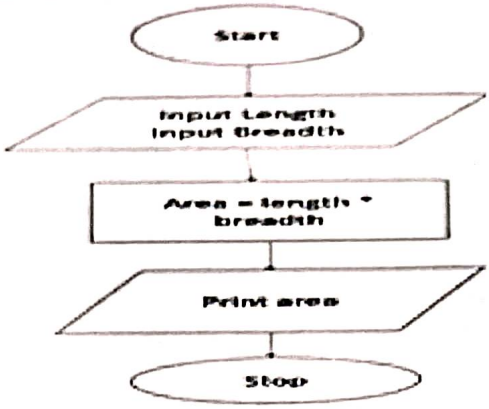
**Output:** Print the result (formatted to 4 decimal places).

**Stop**



PROBLEM 1.1.2

Flowchart



**Start**

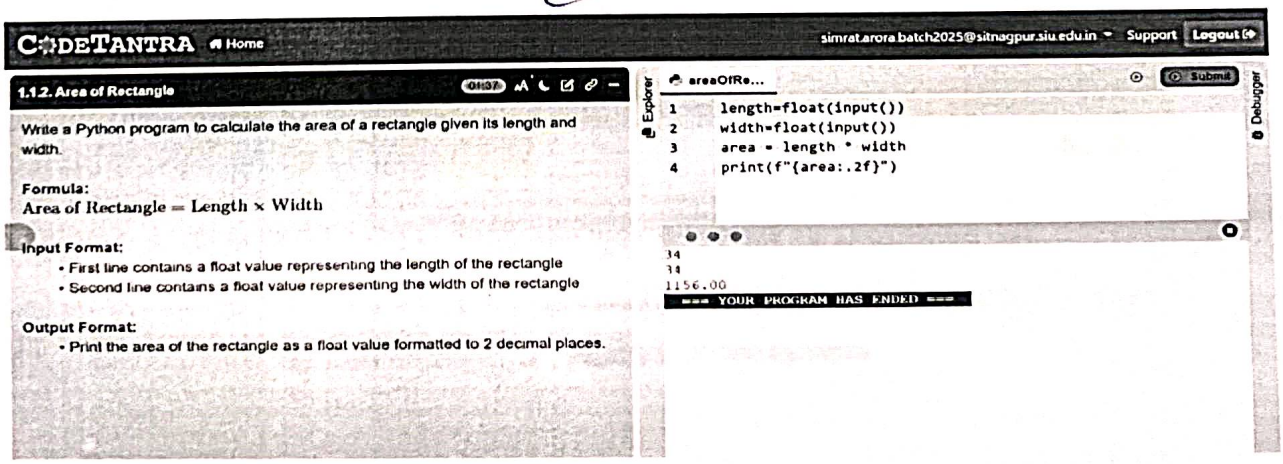
**Input:** Read length and width.

**Process:** Calculate the area by multiplying length *width.

**Output:** Print the result (formatted to 2 decimal places).

**Stop**

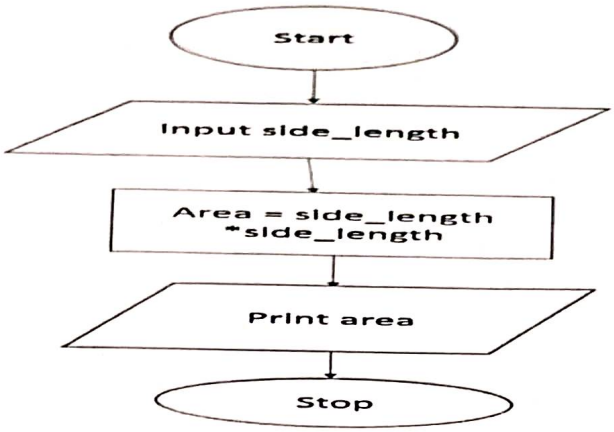
Algorithm



19/02

PROBLEM 1.1.3

Flowchart



Algorithm

**Start**

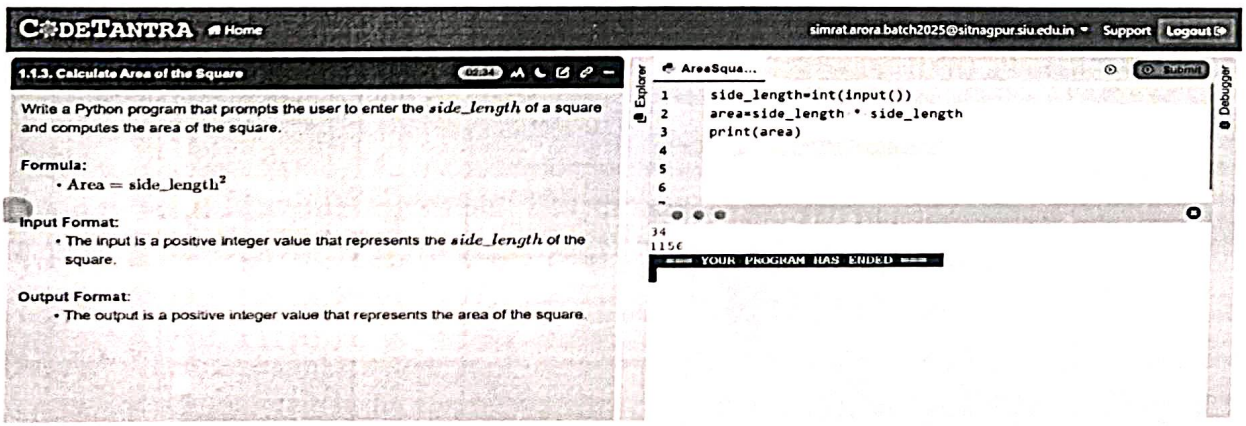
**Input**: Read the value for side_length from the user.

**Process**: Convert the input value to an integer.

**Calculation**: Calculate the area using the formula: Area = side_length$^2$

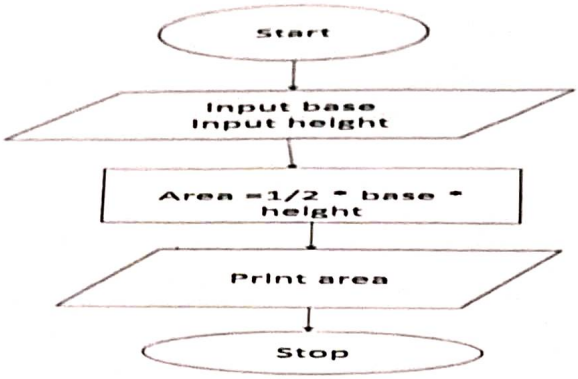
**Output**: Print the calculated area.

**Stop**



PROBLEM 1.1.4

Flowchart



Algorithm

**Start**

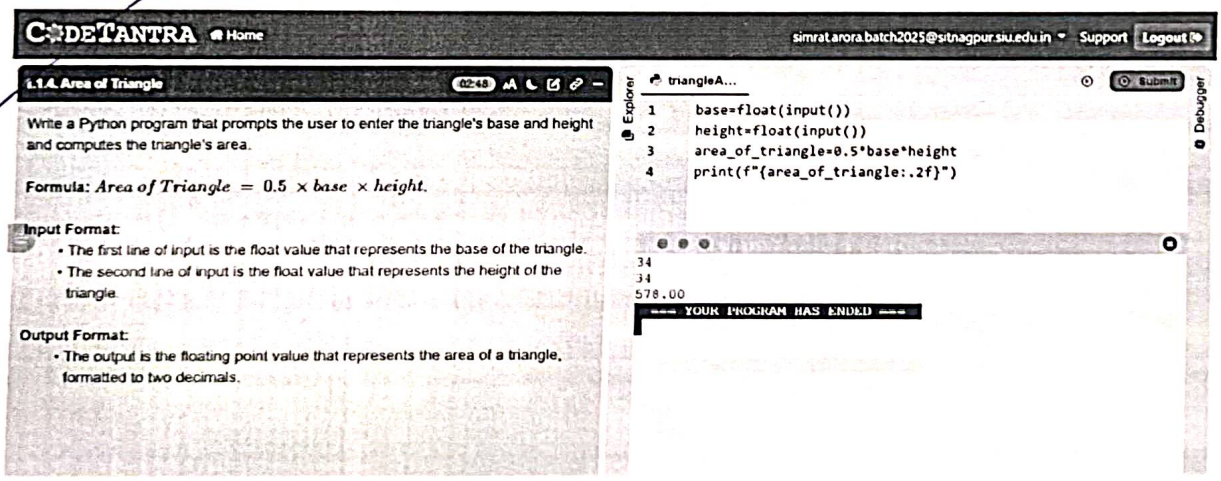
**Input 1:** Read the first value from the user and store it as base.

**Input 2:** Read the second value from the user and store it as height.

**Calculation:** Calculate the area using the formula = Area = 0.5 \times base \times height

**Output:** Print the calculated area, formatted to exactly two decimal places.

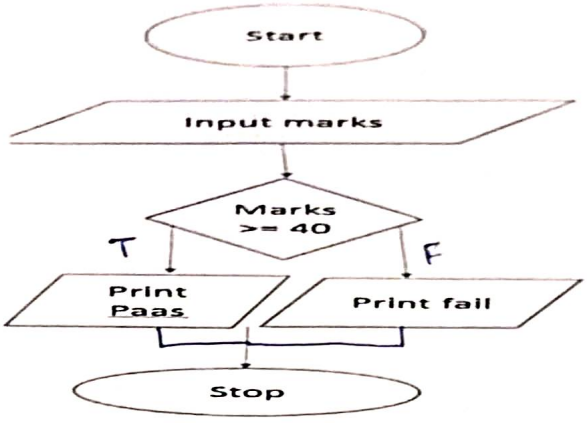
**Stop**



1/12

PROBLEM 1.1.5

Flowchart



Algorithm

**Start**

**Input:** Read the `marks` from the user.

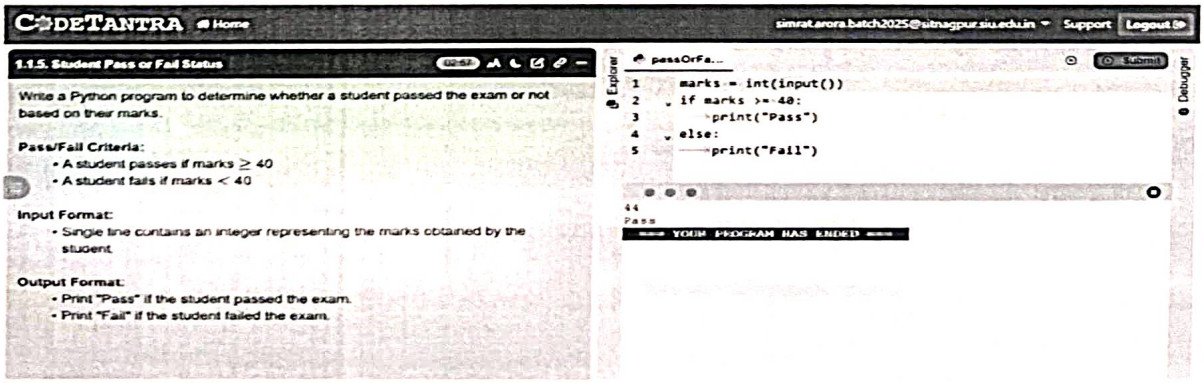
**Process:** Convert the input to an integer.

**Decision:** Check if `marks` is greater than or equal to 40.

**If Yes:** Print "Pass".

**If No:** Print "Fail".

**Stop**



1/2
