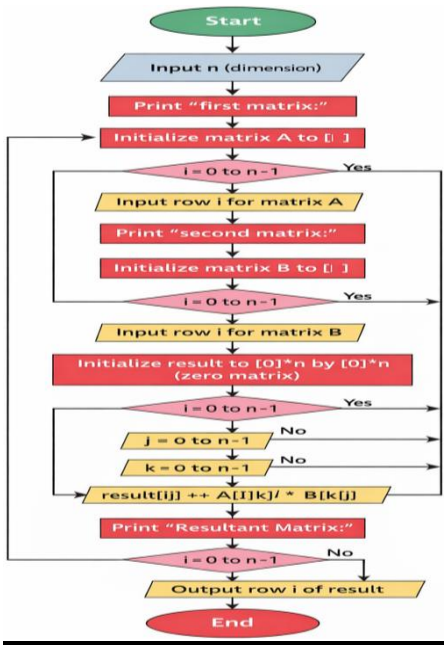
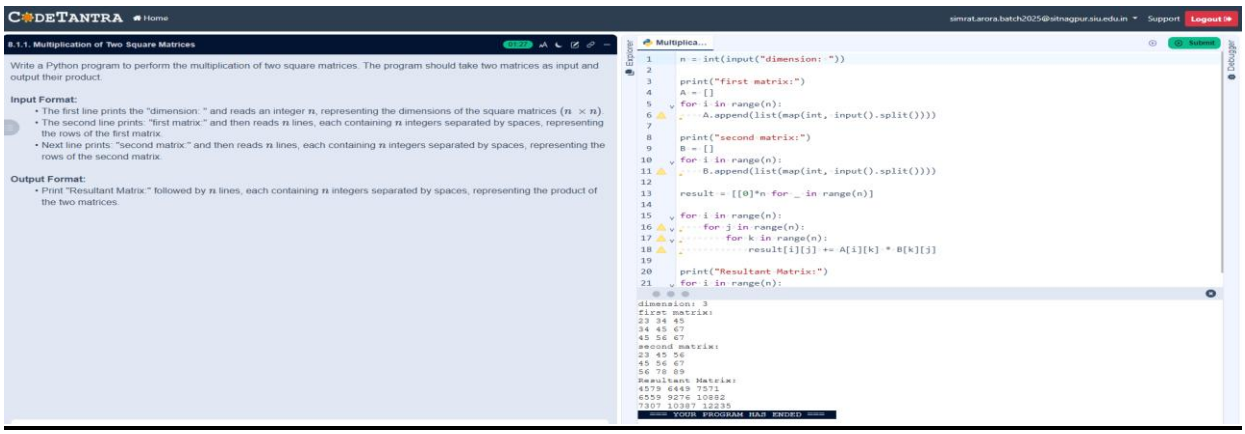
Experiment 8.1.1

Algorithm

1. Start
2. Input n (dimension of matrix)
3. Input first matrix A (n × n)
4. Input second matrix B (n × n)
5. Initialize result matrix result with 0s
6. For each row i from 0 to n-1
    - For each column j from 0 to n-1
        - For each k from 0 to n-1
            - result[i][j] += A[i][k] × B[k][j]
7. Print the result matrix
8. End

Flowchart





Experiment 8.1.2

Algorithm

1. Start
2. Input `start` and `end`
3. Set `found = False`
4. For each number `num` from `start` to `end`:
5. If `num > 1`:

    - Set `is_prime = True`
    - For `i` from `2` to √`num`:
        - If `num % i == 0`:
            - Set `is_prime = False`
            - Break loop
    - If `is_prime == True`:
        - Print `num`
        - Set `found = True` If `found == False`:

6. Print `"No primes"`
7. End
